

Join Game

The client validates the nickname format locally before sending the join request. The server **guarantees** nickname uniqueness when accepting a player.

If the player is the first one in the lobby, the server marks him as host and the client sends the number of players for the match.

After each accepted join, the server sends the updated lobby state to all the clients.

When the expected number of players is reached, the server notifies the start of the game.

We have also a dynamic lobby manager:

- the player can change the lobby whenever he wants,
- if he is the host player and leaves that lobby, the host is reassigned to another player in the lobby, otherwise the lobby is removed

the clientController accepts only nicknames up to 8 characters and checks if nickname and password are not empty. Then the password is hashed with SHA-256 (64 HEX String) before being sent to the network for DB security

To view open lobbies automatically we
send a direct request immediately.
We will receive a lobby DTO
