

Join Game

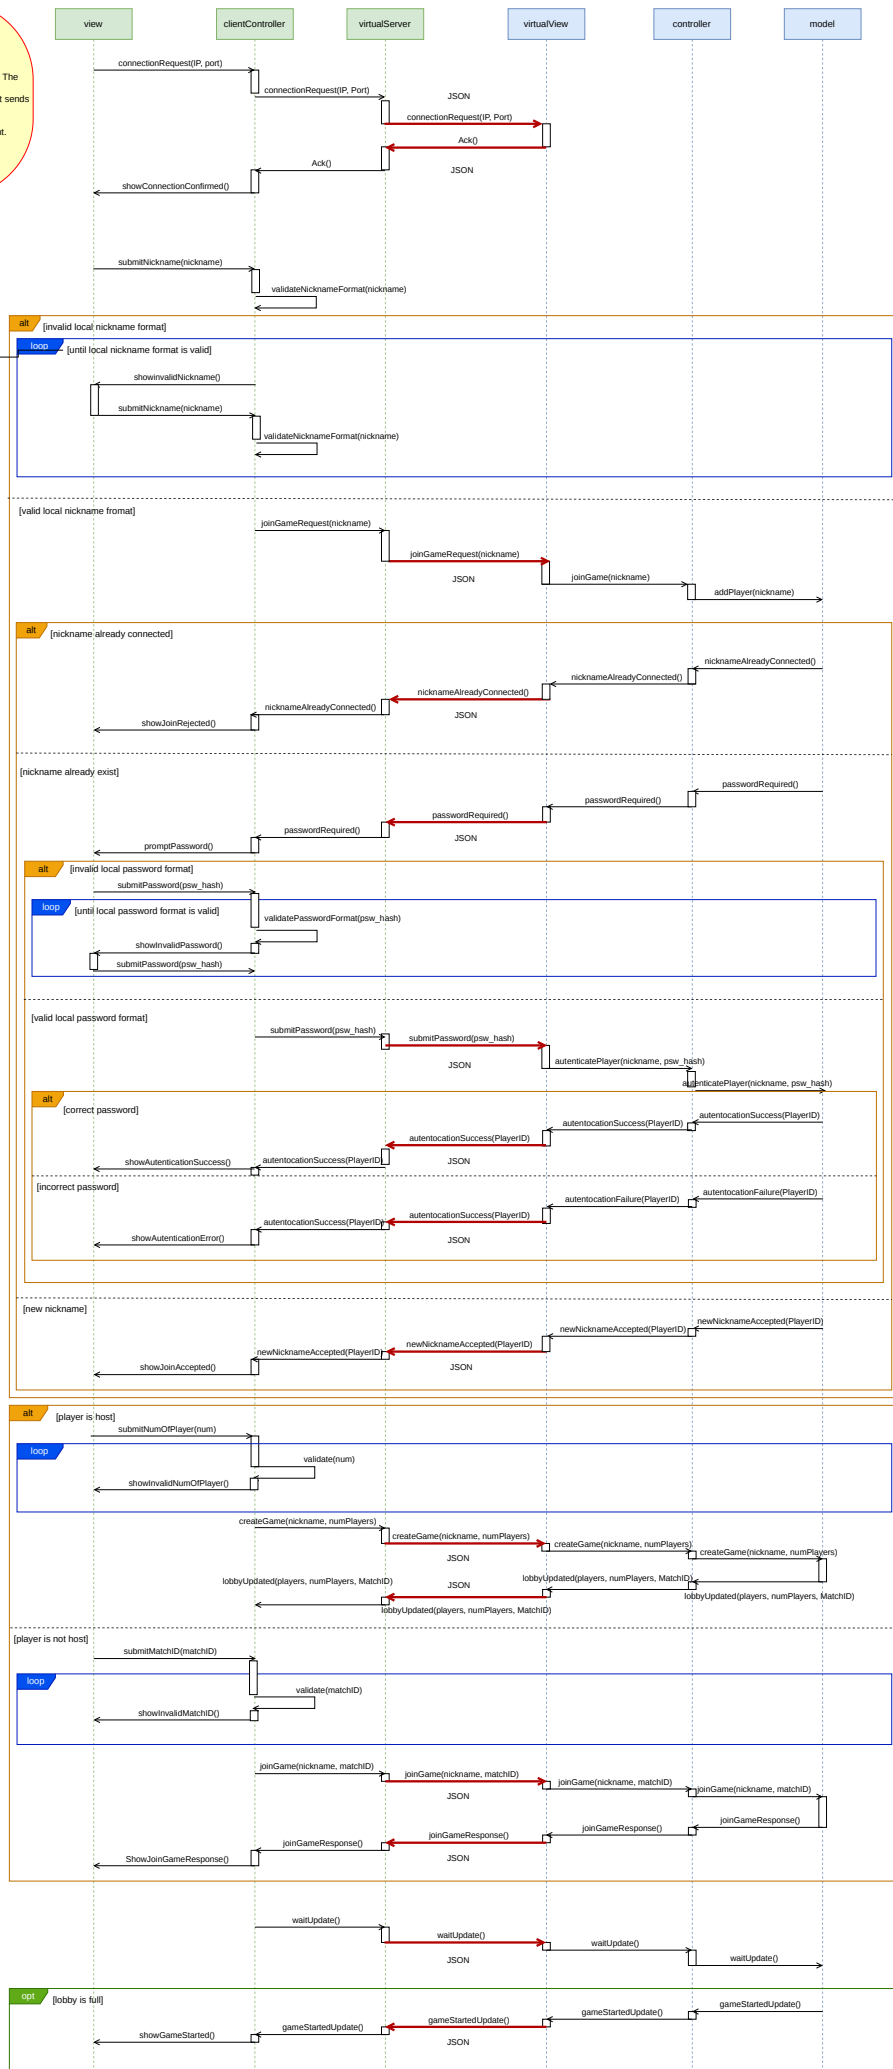

The client validates the nickname format locally before sending the join request. The server guarantees nickname uniqueness when accepting a player. If the player is the first one in the lobby, the server marks him as host and the client sends the number of players for the match.

After each accepted join, the server sends the updated lobby state to the client.

When the expected number of players is reached, the server notifies the start of the game.

Local nickname validation

the clientController doesn't accept only spaces nicknames or nicknames with malicious payload
Ex: " ", "nickln", "<script>"

Database interaction

JoinGameResponse() is a generic Message but it's properly divided into JoinGameSuccess() and JoinGameFailure()
