

Place Totem

The server notifies the active player with the current board state.
The View highlights free OfferTiles on the TurnOrderTile.
The ClientController validates locally (wrong turn, tile occupied)
before sending the action to the server.
The server re-validates, places the totem and **notifies all clients** with the updated board.
The loop repeats until all players have placed their totem, then the **game transitions to OfferTileResolutionState**.

Then the State Pattern will move to the offerTileResolutionState
